

Nathan Kim

Executive Summary - scottyab/rootbeer

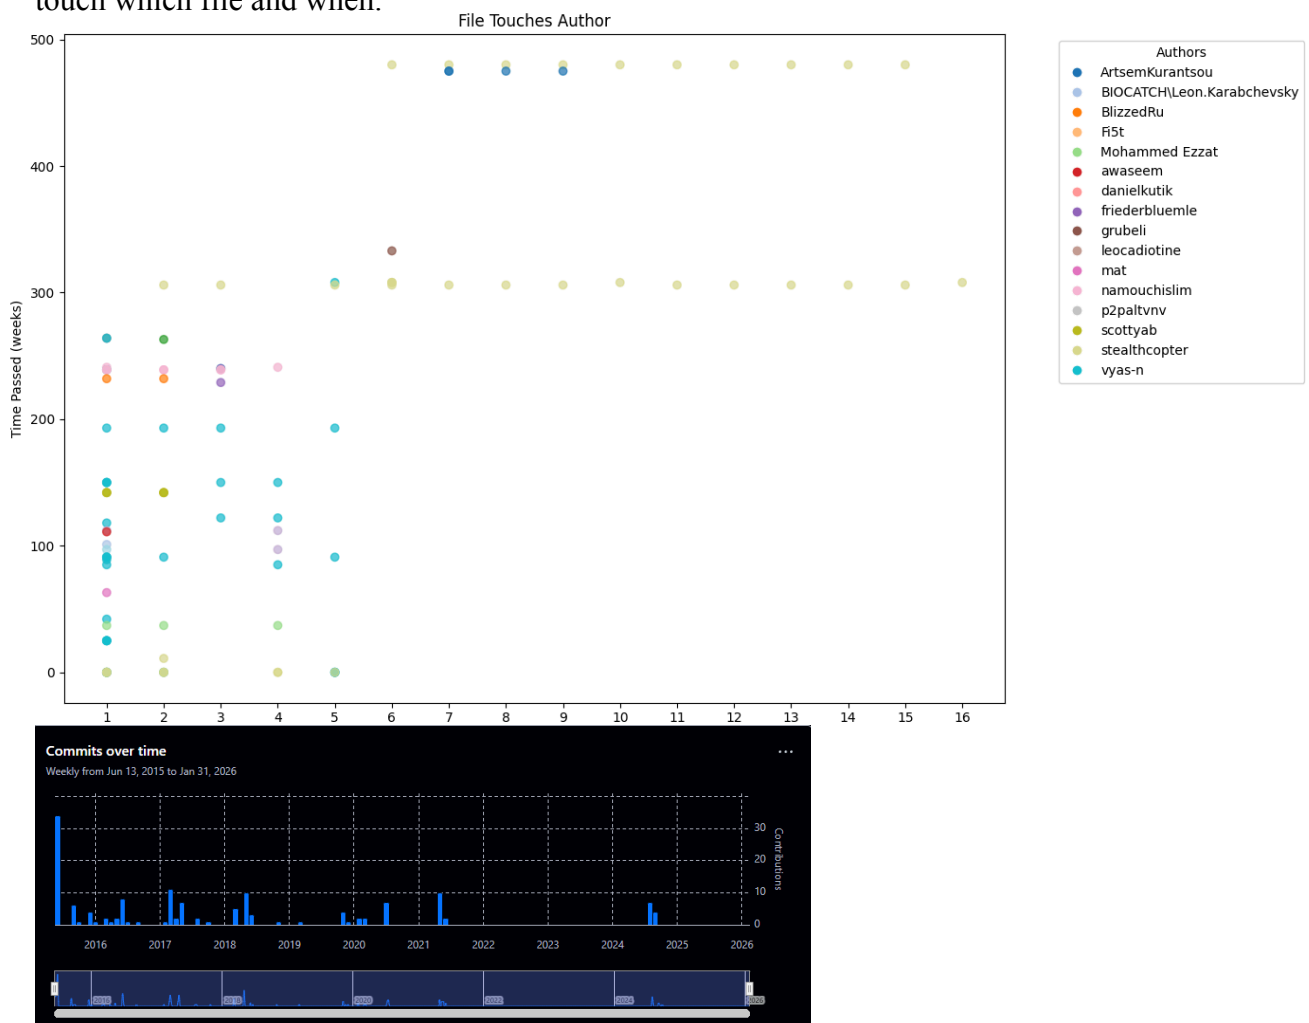

Repository URL: <https://github.com/scottyab/rootbeer>

Fork URL: <https://github.com/Pandamanawsome/Group-2>

Overview:

RootBeer is a repository meant to be used to check if an Android device is accessed via root permissions. This repository has 27 contributors listed on GitHub, as well as a multitude of files written in multiple languages such as Java, Kotlin, C, and C++.

Below is a scatterplot that shows the statistics of which files were touched as well as when each file was touched, from the start of the project. The plot is color coded to indicate which user touch which file and when.

As shown by the scatterplot, the user with the most contribution to the project is Scott Alexander-Bown (scottyab) and Matthew Rollings (stealthcopter). It seems that from the graph, the newer files have had fewer people working on them, as well as fewer commits being made in recent years, indicating a decline in involvement and maintenance in the project.
